Desulfator kit, use to recover sulfated batteries and to prevent sulfation during prolonged float charging and after prolonged storage of charged batteries.

- Components and printed circuit board provided to assemble desulfator as described in HomePower (#77, June/July 2000).
- Creates high frequency (~3 Mhz) pulses and harmonics that both remove and prevent sulfation in 12 volt lead-acid batteries
- Heavy duty MOSFET with substantial heat sink.
- Can be used to rejuvenate some

apparently "dead" batteries

- Simple circuit design features LM555 integrated circuit. Supplied with fuse holder/fuse and alligator clips.
- Two-sided printed circuit board, LM555, MOSFET and all components provided
- Minimum power consumption. Makes high frequency "whine" to confirm operation.
- Requires average soldering skill, no surface mount components
